                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 24, Application US/08788822A
Patent No. 6413935
Patent No. 6413935
APPLICANT: Alexander, Jeffrey L.
APPLICANT: Sette, Alessandro
TITLE OF INVENTION: Induction of Immune Response Against TITLE OF INVENTION: Desired Determinants
NUMBER OF JSEQUENCES: 30
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match 58.9%; Score 33; DB 1; Length 13; Best Local Similarity 83.3%; Pred. No. 6.6; Matches 10; Conservative 0; Mismatches 2; Indels

This PADRE (pan-DR binding) peptide is used in a composition for eliciting an immune response to a non-protein antigenic determinant. The composition comprises of the PADRE peptide covalently linked to the composition comprises of the PADRE peptide covalently linked to the non-protein antigenic determinant. The composition is used to induce a non-protein antigens associated with tumours or infectious agents. It provides a high level, long-lasting IgG immune response. The composition is also used to produce monoclonal antibodies which are potentially useful as therapeutic and diagnostic agents. The composition can be used useful as therapeutic and diagnostic agents. The composition can be useful as therapeutic and diagnostic agents at risk from developing antigenic determinant or to predict subjects at risk from developing chronic infections. PADRE peptides have broader specificity and higher chronic infections. PADRE peptides have broader specificity and higher then the proliferative response of human T cells restricted by at least 6 different DR molecules, and act as helper epitopes of in vivo induction
AAR70250 is capable of binding MHC class II molecules causing T cell activation. This can be used as a vaccine component. The peptide can also be used in combination with CTL peptides to enhance a CTL response.
                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition for eliciting immune response to non-protein determinant - comprises the determinant and a pan-DR binding peptide, used for prevention and treatment of tumours and infections

                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                 Peptides capable of binding MHC class II molecules via antigen binding sites (pan DR-binding peptides) were synthesised. Peptide ARR70249; is capable of binding MHC class II molecules causing T cell activation. This is useful as a vaccine component and may be used in conjunction with CTL peptides to enhance a CTL response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptides capable of binding MHC class II molecules via antigen
binding siges (pan DR-binding peptides) were synthesised. Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inhibiting or inducing an immune response using Pan DR-binding peptide(6) - to prepare a compen. used to treat allo:graft peptide(6) - to prepare a compen. ased to treat allo:graft peptidic response and auto:immunity and as a vaccine rejection, allergic response and auto:immunity and as a vaccine.

The present sequence, a pan DR binding peptide, is capable of binding antigen binding sites on MHC molecules, which are encoded by most of the alleles of a DR locus. The peptide can be used to inhibit or induce MHC Class II mediated activation of T-cells or helper T-cells, which themselves mediate a CTL response. The peptide can be used in mammals, especially humans, to inhibit T-cell-mediated events involved in allograft rejection, allergic responses and autoimmunity and as a vaccine adjuvant for enhancing an immune response against an administered immunogen. The peptide can be used with other immunogens to treat, e.g. prostate cancer, hepatitis B, hepatitis C, AIDS, renal and cervical carcinoma, lymphoma, CMV and condylyloma acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptides that bind to MHC molecules of all DR alleles - inhibiting or inducing MHC class II mediated activation of T cells

The composition comprises of the PADRE peptide covalently linked to the non-protein antigenic determinant. The composition is used to induce a therapeutic or prophylactic response, particularly to selected therapeutic or prophylactic response, particularly to selected polysaccharide antigens associated with tumours or infectious agents. It convides a high level, long-lashing Igd immune response. The composition is also used to produce monoclonal antibodies which are potentially useful as therapeutic and diagnostic agents. The composition can be used to diagnose susceptibility of a patient to becament with the non-protein antigenic determinant or to predict subjects at risk from developing chronic infections. PADRE peptides have broader specificity and higher chronic infections. PaDRE peptides in They are powerful inhibitors of the proliferative response of human T cells restricted by at least 6 different DR molecules, and act as helper epitopes of in vivo induction or construction.

The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 [IL-5] analogues and modified IL-5 brotesins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric, II protein; pan DR epitope; expression vector; promoter; major histocomparibility complex; MRC; targetting; peptide; epitope; antigen; presentation; class I; cytosolic pathway; endoplasmic reticulum; class II; extracellular antigen; endocytic pathway; helper I lymphocyte; HTL; universal epitope; cytoctoxic T lymphocyte; HTL; universal epitope; cytoctoxic T lymphocyte; HTL; universal epitope; vaccine; immunity; infection; pathogen; virus; HTV; HBV; HCV; hepatitis B; hepatitis C; bacterium; protozoan; tumour cell; autoimmune disease; activation; antiviral; antimalarial;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence, a pan DR binding peptide, is capable of binding antigen binding sites on MHC molecules, which are encoded by most of the alleles of a DR locus. The peptide can be used to inhibit or induce MHC Class II mediated activation of T-cells or helper T-cells, which themselves mediated activation of T-cells or peptide can be used in mammals, especially humans, to inhibit T-cell-mediated events involved in allograft rejection, allors an immune response and autoimmunity and as a vaccine adjuvant for enhancing an immune response against an administered immunogen. The peptide can be used with other immunogens to treat, e.g. prostate cancer, hepatitis B, hepatitis C, ALDS, renal and cervical carcinoma, lymphoma, CMV and condylyloma acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptides that bind to MHC molecules of all DR alleles - inhibiting or inducing MHC Class II mediated activation of T cells

The invention relates to a method of determining the surface density of cell-surface molecule on a primary or artificial antigen-presenting cell-surface molecule on a primary or artificial antigen-presenting cell surface area as cell surface area as of the APCs, and calculating the call surface area as a measure of the APCs, and calculating the ratio of the amount of the cull surface molecule to the APCs and calculating the ratio of the amount of the cell surface molecule to the APCs under as a measure of cell surface molecule to the APCs under as a measure of cell surface molecule to the APCs under a sea measure of cell surface molecule to the APCs under a complex of peptide and MHC (major histocompatibility complex) protein/peptide complex on an APC; identifying an agent that increase persistence of the MHC/peptide complex on an APC surface by culturing APCs in presence of test compound and determining the time of persistence relative to an untreated control; and determining the time of persistence relative to an untreated control; and determining the time of persistence relative to an untreated control; complex is 100 molecules/square micrometre or more. The MHC/peptide complex is 100 molecules/square micrometre or more. The complex present on the surface of an APC is suffaced to the reapeutic complex is complex or complex or control or the reapeutic complex is complex or viral or parasitic cultification of the cells as cellular vaccines or for ex vivo expansion of inference or infections. The method can also be used to identify agents that increase the control of APC optimisation of conditions for their generation of the cells) by treatment before and/or during the production, and control of APC quality. Sequences AAB736418 and control of APC repains and for the generation or the peptide specific or production, and control of APC quality. Sequences AAB736418 and control or the production of the repain of the cells of 
                                                                                                                                                                                                                                                                                                                                                                                                         Determining surface density of molecules on antigen-presenting cells, useful for quality control of cellular vaccines for treatment of tumors and infections comprises measuring density ratios -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a universal helper T epitope, pan DR epitope (PADRE), DNA encoding which is used to construct fusion genes used in exemplifications of the present invention. The invention used inventions call acts to a novel expression vector comprising a promoter operably relates to a novel expression vector comprising a promoter operably (MHC) targetting sequence, and two or more heterologous peptide epitopes. The MHC class I epitope to a cytosolic pathway or to the directs an MHC class I epitope to a cytosolic pathway or to the choppanant reticulum, or an MHC class II targetting sequence, which class is entired an entire an endocules of the class of the conformation of the class of the class of the conformation of the class of the combined with other MHC class II epitopes are advantageously combined with other MHC class II and class II epitopes are advantageously combined with other MHC class II and class II epitopes are advantageously combined with other MHC class II and class II epitopes are advantageously combined with other MHC class II and class II epitopes are advantageously combined with other MHC class II and class II epitopes are advantageously combined with other MHC class II and class II epitopes are advantageously combined by combined the combined with other MHC class II and class II epitopes of increase the combined with other MHC class II and cla
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

The present invention describes a composition (I) comprising at least one peptide that comprises an isolated, prepared epitope consisting of a sequence selected from 25 short amino acid sequences given in ABB99680 to ABB99704. Also described are: (I) a composition (II) comprising one or more peptides, and further comprising at least two epitopes selected from the 25 short amino acid sequences (as above), where each of the one or more peptides comprise less than 50 contiguous amino acids that have composition (III) comprising an epitope selected from the 25 short amino acid sequence; and (2) a vaccine or more peptides comprising an epitope selected from the 25 short amino acid sequences (as above) and a pharmaceutical excipient. (I) has acid sequences (as above) and a pharmaceutical excipient. (I) has cytostatic and immunorherapy. The peptide epitope compositions (I)-(II) are uncontoring an immune response to a tumour associated are uncorted antiquent the vaccine mediates the cellular arm of the immune system. In contribute the vaccine mediates immune responses against tumours in contributor, the vaccine mediates immune responses against tumours in contributor, the vaccine mediates immune responses against tumours in contributor, are standard of care for patients being treated for breast, colon, or lung cancer. The present sequence represents a contributor, the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Compositions for use in a vaccine for treating, e.g., breast, lung and colon cancer comprises at least one peptide that comprises an isolated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a composition (I) comprising at least one peptide that comprises an isolated, prepared epitope consisting of a sequence selected from 25 short amino acid sequences given in AAB99680 to AAB99704. Also described are: (I) a composition (II) comprising one comprises, and further comprising at least two epitopes selected from the 25 short amino acid sequences (as above), where each of the one or more peptides comprise less than 50 contiguous amino acids that have composition (III) comprising an epitope selected from the 25 short amino acid sequences (as above) and a pharmaceutical excipient. (I) has acid sequences (as above) and a pharmaceutical excipient. (I) has acid sequences (as above) and a pharmaceutical excipient. (I) has acid sequences (as above) and immunochherapy. The peptide epitope compositions (I)-(II) and useful for monitoring an immune response to a tumour associated antigen or when one or more peptides are combined to create a vaccine (III) that stimulates the cellular arm of the immune system. In particular, the vaccine mediates are combined to create a vaccine individuals who bear an allele of the human leukcoyte antigen (HLM)-A2 supertype and improve the standard of care for patients being treated in an example from the present invention. The present sequence represents a from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Compositions for use in a vaccine for treating, e.g., breast, lung and colon cancer comprises at least one peptide that comprises an isolated epitope of a tumor-associated antigen -

The present invention describes MAGE2/3 epitopes (I). Also described are: (I) a clonal cytotoxic T lymphocyte (CTL) that is cultured in vivo and binds to a complex of (I), (2) a peptide (II) comprising (I) and a second epitope and has less than 50 contiguous amino acids; (3) a vaccine composition comprising (II), a unit dose of a peptide with a least 50 contiguous amino acids with 100% identity to the native peptide sequence of MAGE2/3, and a pharmaceutical excipient; (4) an isolated nucleic acid encoding (I); and (5) an isolated nucleic acid encoding (I). (I) has crooting (I); and (5) an isolated nucleic acid encoding (I). (I) has cytostatic activity, and can be used in vaccines and as an immunostimulant. A vaccine of (3) is useful for the treatment and prevention of cancer. (I) is useful for monitoring or evaluating and immunostimulant and actecting the presence of the T-lymphocyte that binds to the presence of the T-lymphocyte that binds to the pettide. The vaccine allows the opportunity to combine epitopes derived complete in the complete of the total acid sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  An isolated prepared MAGE2/3 epitope (1) for use in pharmaceuticals for the treatment and prevention of cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, HER2/neu; epitope; human leukocyte antigen; HLA; T cell; immune response; vaccine; tumour; cancer; cytostatic; immunostimulant; tumour-associated antigen; T lymphocyte; cytotoxic T lymphocyte; CTL.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a composition (I) comprising at least one peptide that comprises an isolated, prepared epitope consisting of a sequence selected from 25 short amino acid sequences given in ABB99680 to AAB99704. Also described are: (I) a composition (II) comprising one from the 25 short amino acid sequences (as above), where each of the one or more peptides comprise less than 50 contiguous amino acids that have composition (II) comprising an epitope selected from the 25 short amino acids sequence; and (2) a vaccine composition (II) comprising an epitope selected from the 25 short amino acid sequence; and (2) a vaccine composition (II) comprising an epitope selected from the 25 short amino acid sequences (as above) and a pharmaceutical excipient. (I) has composition and immunomodulatory activities and can be used in vaccine production and immunomodulatory activities and can be used in vaccine activity or monitoring an immune response to a tumour associated can tigned or when one or more peptides are combined to create a vaccine particular, the vaccine mediates immune responses against tumours in composition bear an allele of the human leukocyte antigen (HIA)-A2 supertype and improve the standard of care for patients being treated composition and improve the standard of care for patients being treated for rown has an allele of the human leukocyte antigen that the presents and composition and improve the standard of care for patients being treated for for hard and an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                 Human leukocyte antigen A2 binding peptide; HLA class I A2; CTL; ycytotoxic T-cell lymphocyte; tumour associated antigen; CEA; HER2/neu; MAGE2; MAGE3; p53; vaccine; cancer; cytostatic; immunomodulator; immunotherapy; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Compositions for use in a vaccine for treating, e.g., breast, lung and colon cancer comprises at least one peptide that comprises an isolated epitope of a tumor-associated antigen -

Also described are: (1) a clonal cytotoxic T lymphocyte (CTL) that is
culture in vitro and binds to a complex of an epitope (I), bound to a
culture in vitro and binds to a complex of an epitope (I), bound to a
and a second epitope and the peptide is less than 50 contiguous amino
confuse thave 100% identity with a native peptide sequence of HER2/neu;
(C) a vaccine composition (III) comprising (II) and a pharmaceutical
confuse (I) an isolated mucleic acid encoding a peptide comprising
(I) and of an isolated mucleic acid encoding a peptide comprising
(I) and (III) are useful for inducing cellular immune responses for the
confuse (II) are useful for inducing cellular immune responses for the
confuse in and trearment of cancer. (I) and (II) are useful for
confuse when incubated with a T lymphocyte sample form a patient and
celecting the presence of bound T lymphocyte sample form a patient and
celecting the presence of bound T lymphocyte sample form a patient and
celecting the presence of bound T lymphocyte sample form a patient and
confuse when incubated with a T lymphocyte sample form a patient and
celecting the presence of bound T lymphocyte sample form a patient and
confuse whole antigens may be avoided. Selected epitopes that may be present
confused the ability to direct and focus an immune response to multiple
confuse provides the opportunity to combine epitopes derived from
confused the ability and reducing the likelihood of tumour escape due to
cut tumour variability and reducing the likelihood of tumour escape due to
confuse mean likelihood of tumour escape d

The present sequence is that of a PADRE (pan DE epitope) peptide which acts as a T-cell epitope and is capable of binding a large to which acts as a T-cell epitope and is capable of binding a large trian proportion of major histocompatibility complex class II molecules. It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of growth differentiation factor 8 (GPF 88) in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as PADRE, with minimal disturbance of the authentic 3-dimensional concerns muscle mass by up to at least 45% in cattle, pigs and increase muscle meas production, reducing the need for antibiotic politives. Anti-GDF8 vaccines can be used to treat humanned.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 10

10 0-741-453A-25

10 Sequence 25, Application US/07741453A

11 Patent No. 622897

12 GENERAL INFORMATION:

13 APPLICANT: PARKENTIER, MARC

14 APPLICANT: LIBERT, TREDERIC

15 APPLICANT: USBRIT, GILBERT

17 TILE OF INVENTION: POLYPEPTIDES HAVING THYROTROPIN-RECEPTOR

17 TILE OF INVENTION: AND POLYPEPTIDES, AND APPLICATIONS OF THESE POLYPEPTIDES

17 TILE OF INVENTION: AND POLYPEPTIDES, AND APPLICATIONS OF THESE POLYPEPTIDES

18 OUNDER OF SEQUENCES: 62

19 CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

Setent No. 6074645
GENERAL INFORMATION:
TITLE OF INVENTION: DON JEFFREY
APPLICANT: DIAMOND, DON JEFFREY
TITLE OF INVENTION: IMMUNO-REACTIVE PEPTIDE CTL EPITOPES
TITLE OF INVENTION: OF HUMAN CYTOMEGALOVIRUS
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
ADDRESSEE: BART G. NEWLAND
STREET: SSS 13TH STREET, NW SUITE 701E
CITY: WASHINGTON

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 15, Application US/09534639
Patent No. 6251399
GENERAL INFORMATION:
APPLICANT: Diamond, Don J
APPLICANT: York, Joanne
TITLE OF INVENTION: IMMUNO-REACTIVE PEPTIDE CTL EPITOPES OF HUMAN
TITLE OF INVENTION: CYTOMEGALOVIRUS
FILE REFERENCE: 1954-343
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

CyPr-binding protein XF2641 [imported] - Xylella fastidiosa (strain 9a5c)

CySpecies: Xylella fastidiosa

CyDate: 18-Aug-2000 #sequence_revision 20-Aug-2000 #text_change 02-Sep-2000

CyAccession: B82532

Ryanonymous, The Xylella fastidiosa Consortium of the Organization for Nucleotide Sequen Nature 406, 151-157, 2000

A;Title: The genome sequence of the plant pathogen Xylella fastidiosa.

A;Note: for a complete list of authors see reference number A59328 below

Crana D.I., Kalish J.E., Gould S.J.;
The Pichia pastoris pAst gene encodes a ubiquitin-conjugating enzyme required for peroxisome assembly.";
J. Bal. Chem. 269:12183-2184 (1994).
C. -! FUNCTION: CATALYZES THE COVALENT ATTACHMENT OF UBIQUITIN TO COTHER PROTEINS. ESSENTIAL FOR PEROXISOME BIOGENESIS.
C. -! CATALYTIC ACTIVITY: ATP + ubiquitin + protein lysine = AMP + diphosphate + protein N-ubiquityllysine.
C. -! PATHWAY. Ubiquitylin conjugation; second step.
C. -! MISCELLANEOUS: A CYSTEINE RESIDUE IS REQUIRED FOR UBIQUITIN-THIOLOGESTER FORMATION.
C. -! MISCELLANEOUS: A CYSTEINE RESIDUE IS REQUIRED FOR UBIQUITIN-CONJUGATING ENZYME FAMILY.
C. -! SIMLARITY: BELGORG TO THE UBIQUITIN-CONJUGATING ENZYME FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Spectrin Lansatagia (alpha 1/78): a new spectrin variant (alpha 45

Arg-->Thr) with moderate elliptocytogenic potential.;

Br. J. Haematol. 89:933-936(1995).

I- FUNCTION: SPECTRIN IS THE MAJOR CONSTITUENT OF THE CYTOSKELETAL

NETWORK UNDERLYING THE ERYTHROCYTE PLASMA MENBRANE. IT ASSOCIATES

WITH BAND 4.1 AND ACTIN TO FORM THE CYTOSKELETAL SUPERSTRUCTURE OF

THE ERYTHROCYTE PLASMA MEMBRANE.

I- SUBDATT: COMPOSED OF NONHOMOLOGOUS CHAINS, ALPHA AND BETA, WHICH

AGGREGATE SIDE IN AN ANTIPRARALLEL FASHION TO FORM DIMERS,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TETRAMERS, AND HIGHER POLYMERS.
DIEBEASE: HEREDITARY ELLIPPOCYTOSIS (HE) IS A HETEROGENEOUS
DISORDER CHARACTERIZED BY VARIABLE HEMOLYTIC ANEMIA AND ELLIPTICAL
RED CELL STAPE. SPERRAL ARNORMALITIES IN THE MEMBRANE SKELETON
HAVE BEEN IDENTIFIED IN HE, INCLUDING A NUMBER THAT HAVE BEEN
                                                                                                                                                                                                                                                                                                                                                                                                                  Morle L., Morle F., Roux A.F., Godet J., Forget B.G., Denoroy L., Garbarz M., Dhermy D., Kasrally R., Delaunay J., Sectrin Tunis (Sp alpha I/78), an elliptocytogenic variant, is due to the CGG--yGG codon change (Arg-->Trp) at position 35 of the Blood 74:828-832(1989).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE-94250920; PubMed-8193371; Perrotta S., del Giudice E.M., Alloisio N., Sciarratta G., Pinto L., Delaunay J., Cutillo S., Lolascon A., "Mild elliptocytosis associated with the alpha 34 Arg-->Trp mutation in spectrin Genova (alpha 1/74)."; Blood 83:3346-3349(1994).

- PUNCTIONS SPECIFIC CLASS OF HIGH-REDOX-POTENTIAL 4FE-4S

- PUNCTIONS : PENCTIONS IN ANABEOBIC ELECTRON TRANSPORT IN MOST
FERREDOXINS. FUNCTIONS IN ANABEOBIC ELECTRON TRANSPORT IN MOST
PURPLE AND IN SOME OTHER PHOTOSYNTHETIC BACTERIA AND IN AT LEAST
ONE GENUX (PARACOCCUS) OF PHILOPHILIC, DENITRIFYING BACTERIA.

THE MIDPOINT REDOX POTENTIAL FOR THIS PROTEIN IS +323 MV.

- SUBUNIT: HOWODIMER (PROBABLE).

- SIMILARITY: BELONGS TO THE HIGH POTENTIAL IRON-SULFUR PROTEIN

(HIPIP) PAMILY.

-i- FUNCTION: SPECIFIC CLASS OF HIGH-REDOX-POTENTIAL 4FE-4S
FERREDOXIN: FUNCTIONS IN ANABEROE TRANSPORT IN MOST
PURPLE AND IN SOME OTHER PHOTOSYNTHETIC BACTERIA AND IN AT LEAST
ONE GENUS (PARACOCCUS) OF HALOPHILIC, DENITRIFYING BACTERIA.
--- SUBLUNIT: HOWODIWER (PROBABLE).
--- SIMILARITY: BELONGS TO THE HIGH POTENTIAL IRON-SULFUR PROTEIN
(HIPIP) PAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEDLINE-81094036; PubMed=7451471;

Small conductance calcium-activated potassium channel protein 2 (SK2).
KCNN2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       myometrium.";
submitted (JUL-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: FORMS A VOLTAGE-INDEPENDENT POTAGSIUM CHANNEL ACTIVATED
-!- FUNCTION: FORMS A VOLTAGE-INDEPENDENT POTAGSIUM CHANNEL ACTIVATED
BY INTRACELLULAR CALCIUM. ACTIVATION IS FOLLOWED BY MEMBRANE
HYPERPOLARIZATION. THOUGHT TO REGULATE NEURONAL EXCITABILITY BY
CONTRIBUTING TO THE SLOW COMPONENT OF SYNAPTIC
AFTERPYERPOLARIZATION. THE CHANNEL IS BLOCKED BY ADAMIN.
-!- SUBUNIT: HETERO-OLIGOMER. THE COMPLEX IS COMPOSED OF 4 CHANNEL
SUBUNITS EACH OF WHICH BINDS TO A CALMODULIN SUBUNIT WHICH
                                                                                                                                                                                                                                                  SEGMENT S1 (POTENTIAL).

Nature 410:1120-1124(2001).

-I- FUNCTION: FORMS A VOLTAGE-INDEPENDENT POTASSIUM CHANNEL ACTIVATED BY INTRACELLULAR CALCIUM. ACTIVATION IS FOLLOWED BY MEMBRANE HYDRACELLULAR CALCIUM. ACTIVATION IS FOLLOWED BY MEMBRANE HYDRACELLULAR CALCIUM. ACTIVATION IS FOLLOWED BY ACTIVITY BY CONTRIBUTING TO THE SLOW COMPONENT OF SYNAPTIC AFTERHYBRPOLARIZATION. THE CHANNEL IS BLOCKED BY APAMIN.

-I- SUBUNIT: HETERO-OLIGOMER. THE COMPLEX IS COMPOSED OF 4 CHANNEL SUBUNITS EACH OF WHICH BINDS TO A CALMODULIN SUBUNIT WHICH REGULARIZE THE CHANNEL ACTIVITY THROUGH CALCIUM-BINDING.

-I- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-I- TISSUE SPECIFCITY: BRAIN.
